

# Data sheet

## LXR- $\beta$ <sup>His</sup>

Liver-X Receptor,  $\beta$ -isoform  
human, recombinant, *E. coli*

Cat. No.	Amount
PR-745	10 $\mu$ g

For *in vitro* use only  
Quality guaranteed for 12 months  
Store at -80°C

### Avoid freeze / thaw cycles

### Form

Liquid. Supplied in 20 mM Tris-HCl pH 8.0, 100 mM KCl, 0.2 mM EDTA, 1 mM DTT and 20% glycerol.

### Activity

20 ng are sufficient for a gel-mobility shift assay and 100 ng are sufficient for a protein-protein interaction assay.

### Application

LXR has been applied in DNA and protein-protein interactions assays.

### Molecular Weight

53.3 kDa

### Purity

> 90% by SDS-PAGE

### Description

The His-tag recombinant protein is purified by affinity chromatography in combination with FPLC columns.

Liver X Receptors (LXRs) are nuclear receptors that regulate the metabolism of cholesterol and bile acids. There are two subtypes of LXRs, LXR and LXR. LXR is preferentially expressed in liver, small intestine, kidney and spleen. In contrast, LXR expression is ubiquitous. The genomic structure and the promoter regions of the two LXR genes contain specific regulatory sites, which suggest that LXRs may have physiological roles in the immune system. Like other nuclear receptors, LXRs heterodimerize with Retinoid X Receptor (RXR) for function. LXRs are activated by naturally occurring oxysterols and regulate the expression of target genes, including ATP binding cassette transporter 1 (ABC1), ATP binding cassette transporter 8 (ABC8) and cholesterol ester transfer protein (CETP). LXR $\beta$  expressed in livers of LXR $\alpha$  knockout mice does not compensate for the loss of LXR $\alpha$ . In addition, LXR $\beta$ , but not LXR $\alpha$ , is also able to activate transcription of a reporter gene, which contains a specific direct repeat separated by 1 bp (DR1) element in the promoter, suggesting that LXR $\beta$  may have different biological functions.

Recombinant LXR is isolated from an *E. coli* strain that carries the coding sequence of the human LXR $\beta$  under the control of a T7 promoter.
